

BRAND GUIDELINES

Greenbelt Electrical

VISUAL IDENTITY & WEB DESIGN STANDARDS

A practical color, type, and usage reference for the website build — engineered to read as licensed, trustworthy, and easy to use for an older client base.

The short version

Greenbelt Electrical is a licensed C-10 contractor (License #1053285) serving Humboldt County since 2015. The brand should feel exactly like the company is: established, certified, dependable, and local. Every design decision in this document serves one goal — making a homeowner or business owner feel safe hiring them in the first few seconds on the page.

How to use this document

This is a working reference for the web designer, not a rigid rulebook. The color values, contrast rules, type scale, and button styles here are tested and ready to drop into the Next.js + Tailwind build. Where a value matters for accessibility or conversion, the reasoning is included so the “why” travels with the “what.”

Who we are designing for

Greenbelt’s buying audience skews older — homeowners arranging panel upgrades, rewires, and EV chargers, plus property and facility managers. That single fact drives much of this guide: larger type, very high contrast, warm and legible color pairings, generous tap targets, and zero reliance on color alone to communicate. Designing well for an older audience produces a cleaner, faster, more trustworthy site for everyone.

Note on color values: The brand hex codes on the next page were sampled from the supplied logo and are accurate for screen use. Before final production, confirm them against Greenbelt’s master vector logo file if one exists, so print and signage stay perfectly matched.

SURFACE Off-White HEX #FAFAF8 RGB 250 250 248		

Why two greens? The bright **Greenbelt Green** is the brand's signature — but it is too light to carry white text (see contrast page). Use it for accents, icons, and highlights. **Deep Forest** is its workhorse partner for large filled areas, headers, and buttons where white text must stay readable. Together they keep the brand “green” without ever sacrificing legibility.

Color that builds confidence

The trust rationale

Visitors form a credibility judgment about a website in well under a second, before reading a word — and color is a primary driver of that snap judgment. Green is widely read as safe, dependable, and “cleared to go,” which is ideal for a licensed trade. Greenbelt’s existing green is an asset; the strategy is to anchor it with deep, grounded tones and disciplined contrast so the whole palette reads as organized and professional rather than loud.

Designing for older eyes

As people age, the eye’s lens yellows and contrast sensitivity drops. Blues and purples get harder to tell apart, while warm colors and high-contrast pairings stay easy to read. That is good news here: Greenbelt’s warm **Voltage Yellow** is highly visible to older viewers — as long as it carries dark text, never white. The practical rules: aim higher than the minimum on contrast, keep body text large, and never use color as the only signal (pair it with text, icons, or underlines).

Tested contrast — use these pairings

FOREGROUND	BACKGROUND	RATIO	RESULT	USE FOR
Charcoal #1A1A1A	Off-White	17.4:1	AAA	All body text
White	Deep Forest #1E4D2B	9.8:1	AAA	Headers, primary buttons
Charcoal	Voltage Yellow	10.8:1	AAA	Call-to-action buttons
Voltage Yellow	Panel Black	11.8:1	AAA	Accents on dark sections
Charcoal	Greenbelt Green	6.8:1	AA	Dark text on green chips
White	Greenbelt Green	2.6:1	FAIL	— avoid this
White	Voltage Yellow	1.6:1	FAIL	— avoid this

Targets: WCAG 2.1 AA requires 4.5:1 for body text and 3:1 for large text. The pairings above clear AA comfortably and most hit AAA (7:1+), giving older visitors extra margin. Re-check any new color combination at webaim.org/resources/contrastchecker before shipping.

Applying color on the site

Buttons & calls-to-action

One job per button color. The **primary action** — “Call Now,” “Request an Estimate” — gets **Voltage Yellow with charcoal text**: warm, high-attention, and the most readable pairing for older users. Secondary actions use **Deep Forest with white text**. Use only one yellow primary button per screen so the eye always knows where to go next.

Primary (Voltage Yellow) · Secondary (Deep Forest) · Tertiary / ghost (Deep Forest outline)

Where each color belongs

- **Panel Black / Deep Forest** — header bar, footer, and full-width “hero” bands, echoing the logo’s dark badge.
- **Greenbelt Green** — section accents, icons, checkmarks, stat numbers, link underlines, hover states.
- **Voltage Yellow** — the primary CTA, phone-number highlights, and the occasional “Licensed & Insured” trust badge. Use sparingly so it keeps its punch.
- **Off-White** — default page background. Avoid pure stark white for large areas; the soft off-white is easier on aging eyes.
- **Charcoal / Conduit Gray** — body copy and secondary text respectively.

✓ DO

- Put dark text on green and yellow.
- Lead with one clear yellow CTA per view.
- Reserve dark backgrounds for headers, footers, and hero bands.
- Pair color cues with a label or icon.

✗ DON'T

- Put white text on green or yellow.
- Use green for long blocks of body text.
- Fill a whole page with bright green or yellow.
- Signal status with color alone (e.g. red/green only).

Typography

Use one clean, modern sans-serif family across the whole site. It loads fast, reads well at large sizes, and stays neutral so the brand color does the talking. Recommended: **Inter** or **Source Sans 3** for everything, with a heavier weight for headings. Both are free Google Fonts and pair perfectly with the Next.js + Tailwind stack.

DISPLAY / HERO — 40-56PX · BOLD (700)

Licensed electricians, Humboldt County

HEADING — 24-32PX · SEMIBOLD (600), DEEP FOREST

Panel upgrades, EV chargers & rewiring

BODY — 18-20PX ON THE LIVE SITE · REGULAR (400)

Body copy should run noticeably larger than a typical site. An 18-20px base with 1.6 line-height keeps paragraphs comfortable for older readers and reduces the need to zoom. Keep line length to roughly 60-75 characters.

Type rules for an older audience: minimum 18px body on screen · line-height 1.5-1.65 · left-aligned (never justified) · real headings in semantic order (one h1, then h2/h3) · avoid all-caps for long text and avoid thin/light weights for body. Numbers in phone numbers and license IDs should be large and tappable.

Logo & layout rules

Logo usage

- Use the supplied master logo file — the badge on the cover of this document is a layout reference, not the production artwork.
- Keep clear space around the badge equal to at least the height of one lightning bolt.
- Minimum display size: 48px tall in the header; larger anywhere it's a focal point.
- The badge already reads on dark; on light backgrounds give it room and avoid placing it on busy photos.
- Don't recolor, stretch, add shadows, or rotate the badge.

Layout & UX

- Phone number visible in the header on every page — large and click-to-call.
- Tap targets at least 44×44px with generous spacing.
- Simple, predictable top navigation; no hidden menus on desktop.
- One primary action per screen; repeat the CTA down long pages.
- Always-visible focus outlines for keyboard users (never `outline:none`).
- Generous whitespace; avoid clutter and dense columns.

Trust signals to surface visually

Because trust is the whole game here, give these elements real visual weight — near the top of the homepage and repeated in the footer: the **C-10 License #1053285**, **"Serving Humboldt County since 2015,"** consistent Name / Address / Phone, Google reviews, and an "Insured" or "Licensed" badge. These are exactly the cues an older buyer scans for before calling.

Accessibility is non-negotiable: WCAG 2.1 AA throughout — descriptive alt text, captioned video, labeled form fields, semantic landmarks, and a working "skip to content" link. This protects the older audience and the client's legal exposure alike.

Designer handoff cheat sheet

COLOR TOKENS

TOKEN	HEX
green / primary	#5CB63B
yellow / accent · CTA	#F2C829
black / ground	#111111
forest / headers·btn	#1E4D2B
gray / neutral	#3C3C3C
charcoal / text	#1A1A1A
surface / bg	#FAFAF8

NON-NEGOTIABLES

- ❑ Dark text on green & yellow — never white
- ❑ Yellow = primary CTA, used once per view
- ❑ Body text 18px+, line-height ~1.6
- ❑ Contrast checked, AA minimum
- ❑ Click-to-call phone in header
- ❑ Tap targets 44px+
- ❑ Visible keyboard focus states
- ❑ License # & “since 2015” above the fold
- ❑ WCAG 2.1 AA across the board

The one-line brief

Dark, grounded sections like the logo’s badge; bright green for life and accent; one warm yellow button that always points the way; big readable type; and contrast high enough that a 70-year-old never has to squint. Built right, it reads as *licensed, local, and trustworthy* — instantly.
